

ABSTRACT OF THE DISCLOSURE

To provide an electrophotographic method and apparatus for forming images stably having a good, agreeable, and natural texture in gloss equivalent to conventional silver halide photographic prints, an electrophotographic image-receiving sheet for use in the formation of such images and such an electrophotographic print, an image forming process produces an electrophotographic print by fixing a toner image on an electrophotographic image-receiving sheet using a belt fixing device of cooling and separating system. In the electrophotographic print, a specular glossiness $G_sP(45^\circ)$ and a reflected light scattering index $G_sP (*45\pm3^\circ)$ of a black print image on the toner image-bearing surface of the electrophotographic print satisfy specific conditions.
